

## Pool Support Installation Instructions for Oval Frame Pools and Rectangular Metal Frame Pools

For the proper installation of your new pool, each of the side supports require the placement of a "foot pad" flush with the group prior to filling water, as shown below.

These foot pads are necessary to prevent the side supports from sinking into the soil. Failure to install the foot pads could result in permanent damage to your pool's metal frame, and possible collapse of the pool.

These foot pads, or solid cap blocks, are found in any building supply store or lumber.
